Agenda and reminders

Exam 1 next Monday (October 6)

- Data wrangling fundamentals (select, filter, mutate, summarize, group_by, etc.)
- Reshaping data (pivoting), joins (left join, inner join)
- Wrangling across columns (across, starts_with, where, etc.)
- Iteration (for loops, while loops, map)
- Functions and simulations

Agenda and reminders

- Exam 1 next Monday (October 6)
 - You will read and write short pieces of code
 - I expect you to know what kind of things are possible in R (key ideas like joining, reshaping data, summarizing, grouping, iterating, etc.)
 - I expect you to be familiar with key functions in R
 - Minor syntax errors will not be penalized
 - Example review questions on course website
 - Also look back at class activities and examples

Agenda and reminders

- Exam 1 next Monday (October 6)
 - Review day this Friday (October 3)
- Today: lists
- Wednesday: more on functions (function defaults, function scoping)
- After exam 1:
 - Functions and unit tests
 - Starting text wrangling

Previously: purrr::map

```
1 grade_files <- list.files("intro_stats_grades", full.names=T)
2 grade_tables <- map(grade_files, read_csv)</pre>
```

map: apply a function to each element of a list or vector

Output: a list

```
1 typeof(grade_tables)
[1] "list"
 1 length(grade_tables)
[1] 10
 1 glimpse(grade_tables[[1]])
Rows: 35
Columns: 14
$ student_id <dbl> 55817, 32099, 40295, 54195, 15297, 81786, 49747,
78226, 102...
$ hw_1 <dbl> 10, 10, 10, 10, 7, 10, 10, 9, 9, 8, 10, 10, 7,
8, 8, 10...
```

Vectors revisited

Vectors can contain numbers, booleans, characters, etc:

```
1 \times < -c(0, 1, 2)
 2 x
[1] 0 1 2
 1 typeof(x)
[1] "double"
 1 x <- c("a", "b", "c")
 2 x
[1] "a" "b" "c"
 1 typeof(x)
[1] "character"
```

The typeof function tells what type of object we have

Vectors of multiple types?

```
1 x <- c(0, 1, "a")
2 x
3 x[1] + 1
```

What do you think will happen when we run this code?

Vectors of multiple types?

```
1 x <- c(0, 1, "a")
2 x

[1] "0" "1" "a"

1 x[1] + 1
```

Error in x[1] + 1: non-numeric argument to binary operator

Basic vectors (called atomic vectors) only contain one type.

```
1 x <- list(c(0, 1), "a")
2 x

[[1]]
[1] 0 1

[[2]]
[1] "a"</pre>
```

```
1 x <- list(c(0, 1), "a")
 2 x
[[1]]
[1] 0 1
[[2]]
[1] "a"
 1 x[[1]]
[1] 0 1
 1 x[[1]][1]
[1] 0
```

```
1 x <- list(c(0, 1), "a")
 2 x
[[1]]
[1] 0 1
[[2]]
[1] "a"
 1 x[[1]]
[1] 0 1
 1 x[[1]][1]
[1] 0
 1 typeof(x[[1]])
[1] "double"
 1 x[[2]]
[1] "a"
 1 typeof(x[[2]])
```

Visualizing list structure

[[2]][[1]]

```
1 \times 1 \leftarrow list(c(1, 2), c(3, 4))
 2 x1
[[1]]
[1] 1 2
[[2]]
[1] 3 4
 1 x2 <- list(list(1, 2), list(3, 4))
 2 x2
[[1]]
[[1]][[1]]
[1] 1
[[1]][[2]]
[1] 2
[[2]]
```

[1] 3

[[2]][[2]]

```
1 \times <- list(c(1, 2), c(3, 4))
 3 x[1]
[[1]]
[1] 1 2
 1 typeof(x[1])
[1] "list"
 1 x[[1]]
[1] 1 2
 1 typeof(x[[1]])
[1] "double"
```

- x[1] returns a *list* which contains the first component of
- x[[1]] returns the object stored in the first component

```
1 x <- list(list(1, 2), list(3, 4))
2 x[1]
```

Question: What will \times [1] return?

```
1 x <- list(list(1, 2), list(3, 4))
2 x[1]

[[1]]
[[1]] [[1]]
[1] 1</pre>

[[1]][[2]]
[1] 2
```

```
1 x <- list(list(1, 2), list(3, 4))
2 x[[1]]</pre>
```

Question: What will x[[1]] return?

```
1 x <- list(list(1, 2), list(3, 4))
2 x[[1]]
[[1]]
[1] 1</pre>
[[2]]
[1] 2
```

Question: How do I get just the 3?

```
1 x <- list(list(1, 2), list(3, 4))
2 x[[2]][[1]]
[1] 3</pre>
```

Class activity
